The United States Environmental Protection Agency (EPA) and Calumet City Water Department are concerned about lead in your drinking water. Although most homes have very low levels of lead in their drinking water, some homes in the community have lead levels above the EPA action level of 15 parts per billion (ppb), or 0.015 milligrams of lead per liter of water (mg/L). Under federal law we are required to have a program in place to minimize lead in your drinking water by to be determined.

This program includes:

1. Corrosion control treatment (treating the water to make it less likely that lead will dissolve into the water);

2. Source water treatment (removing any lead that is in the water at the time it leaves our treatment facility); and

3. A public education program.

We are required to replace the portion of each lead service line that we own if the line contributes lead concentrations of more than 15 ppb after we have completed the comprehensive treatment program. If you have any questions about how we are carrying out the requirements of the lead regulation please give us a call at 708-891-8155.

This brochure also explains the simple steps you can take to protect yourself by reducing your exposure to lead in drinking water.

HEALTH EFFECTS OF LEAD

Lead is a common metal found throughout the environment in lead-based paint, air, soil, household dust, food, certain types of pottery porcelain and pewter, and water. Lead can pose a significant risk to your health if too much of it enters your body.

Lead builds up in the body over many years and can cause damage to the brain, red blood cells and kidneys. The greatest risk is to young children and pregnant women. Amounts of lead that won’t hurt adults can slow down normal mental and physical development of growing bodies. In addition, a child at play often comes into contact with sources of lead contamination - like dirt and dust - that rarely affect an adult. It is important to wash children’s hands and toys often, and to try to make sure they only put food in their mouths.

LEAD IN DRINKING WATER

Lead in drinking water, although rarely the sole cause of lead poisoning, can significantly increase a person’s total lead exposure, particularly the exposure of infants who drink baby formulas and concentrated juices that are mixed with water. EPA estimates that drinking water can make up 20% or more of a person’s total exposure to lead.

HOW LEAD ENTERS OUR WATER

Lead is unusual among drinking water contaminants in that it seldom occurs naturally in water supplies like rivers and lakes. Lead enters drinking water primarily as a result of the corrosion, or wearing away, of materials containing lead in the water distribution system and household plumbing. These materials include lead-based solder used to join copper pipe, brass and chrome-plated brass faucets, and in some cases, pipes made of lead that connect your house to the water main (service lines). In 1986, Congress banned the use of lead solder containing greater than 0.2% lead, and restricted the lead content of faucets, pipes and other plumbing materials to 8.0%.

When water stands in lead pipes or plumbing systems containing lead for several hours or more, the lead may dissolve into your drinking water. This means the first water drawn from the tap in the morning, or later in the afternoon after returning from work or school, can contain fairly high levels of lead.

STEPS TO REDUCE EXPOSURE TO LEAD IN DRINKING WATER

Despite our best efforts mentioned earlier to control water corrosivity and remove lead from the water supply, lead levels in some homes or buildings can be high. To find out whether you need to take action in your own home, have your drinking water tested to determine if it contains excessive concentrations of lead. Testing the water is essential because you cannot see, taste, or smell lead in drinking water. Some local laboratories that can provide this service are listed at the bottom of this brochure. For more information on having your water tested, please call 708-891-8155.

If a water test indicates that the drinking water drawn from a tap in your home contains lead above 15 ppb, then you should take the following precautions:

1. FLUSH YOUR SYSTEM.

Flushing tap water is a simple and inexpensive measure you can take to protect your family’s health. Flushing usually uses less than one or two gallons of water and costs less than $.22 per month based on flushing twice a day per month.

To flush, let the water run from the tap before using it for drinking or cooking any time the water in a faucet has gone unused for more than six hours. The longer water resides in your home’s plumbing, the more lead it may contain. Flushing the tap means running the cold water faucet until the water gets noticeably colder, usually about 15-30 seconds. If your house has a lead service line to the water main, you may have to flush the water for a longer time, perhaps one minute, before drinking. Although toilet flushing or showering flushes water through a portion of your home’s plumbing system, you still need to flush the water in each faucet before using it for drinking or cooking.

To conserve water, fill a couple of bottles for drinking water after flushing the tap, and whenever possible use the first flush water to wash dishes or water plants.

If you live in a high-rise building, letting the water flow before using it may not lessen your risk from lead. This is because high rise plumbing systems have more, and sometimes larger pipes than smaller buildings. Ask your landlord for help in locating the source of the lead and for advice on reducing the lead level.

2. USE ONLY ONE FAUCET AT A TIME

Try not to cook with hot water tap. Hot water is the most likely to be lead more quickly than room water, draw water down in several minutes, then heat it on the stove.

3. REMOVE LEAD FROM PLUMBING

Remove loose scale and rust from pipes which the plumber, by using a pressure tank, can remove the faucet water from 3-5 minutes before cleaning the pipes with a soft brush and then flush for an additional minute or two.

4. IDENTIFY ALL WATER SOURCES

If your copper pipe is installed illegally by a plumber who did the installation, have the lead solder with the copper pipe cut away, and when service is restored notify your State of intermediate lead content.

5. FIND OUT WHAT YOUR HOME IS MADE OF

Determine whether your home or apartment is best way to determine if plumbing or by either hiring a lead is made of lead piping or by contacting the plumbing code in your building. You can identify the lead-in of your home by a licensed plumber or by looking at your home’s plumbing records. The lead-in pipe delivers water to your house. It can be made of materials located at the main line that connects to your home. The materials line that contribute more than 8% lead are:

- Lead or lead solder
- Copper with a lead lining
- Copper with a lead solder
- Copper with a lead lining

PUBLIC SERVICE ANNOUNCEMENT

LEAD USES

Information

This is a public service announcement of the City of Calumet City. We are notifying the residents of the potential health risks associated with lead in drinking water. It is important for everyone to understand these risks and take appropriate actions to protect themselves and their families.

1. LEAD IN WATER

- Lead is a heavy metal that can cause serious health problems, especially for children and pregnant women.
- Lead can enter drinking water through corrosion of lead-based plumbing materials, such as pipes, fittings, and fixtures, which can release lead into the water.

2. UNDERSTAND YOUR RISK

- The risk of lead exposure depends on the age of your plumbing and the materials used.
- Elderly houses may have more lead problems due to older plumbing systems.
- Newer homes with lead-free materials may still have lead from corrosion of older plumbing or fromffduty materials.

3. WHAT TO DO IF YOU SUSPECT LEAD EXPOSURE

- Monitor your water for lead, and if levels are high, take steps to reduce exposure.
- Contact your local water utility to consult with a licensed plumber or use a lead-safe certified contractor to help you understand your specific situation.

4. LEAD IN WATER TREATMENT OPTIONS

- There are several methods to reduce lead in water, such as whole-house filters, inline filters, and lead service line replacement.
- Consider installing a water treatment system that is certified to remove lead.

5. MAINTAIN YOUR SYSTEM

- Regularly clean your plumbing systems to prevent lead from entering the water.
- Replace any lead pipes or fittings as soon as possible.

6. LEAD IN FRESHWATER FISH

- Fish contain lead, which can accumulate in the body over time.
- To minimize lead exposure, avoid eating fish from areas known to have high lead levels.

FOR MORE INFORMATION

You can consult a variety of sources for additional information:

- Your family doctor or pediatrician can perform a blood test for lead and provide you with information about the health effects of lead.

State and local government agencies that can be contacted include:

Calumet City Water Department at 708-891-8155 can provide you with information about your community's water supply, and a list of local laboratories that have been certified by EPA for testing water quality.

Calumet City Inspection Service at 708-891-8120 can provide you with information about building permit records that should contain the names of plumbing contractors that plumbed your home; and

Cook County Department of Public Health at 708-633-4000 can provide you with information about the health effects of lead and how you can have your child's blood tested.

The following is a list of some State approved laboratories in your area that you can call to have your water tested for lead.
Suburban Labs 708-544-3260 or McHenry Analytical Water 815-344-4044.

For more information, contact the City of Calumet City at 708-891-8155.
